

❖ Problem Context

- Organisations receive news, reports, advisories, threat intelligence, policy documents, research papers and incident notes.
- The same source must be converted into different communication artefacts for different audiences.
- Manual analysis, rewriting and formatting consumes time and requires domain + content expertise.

❖ Current Gap

- No single configurable dashboard for source-to-output transformation.
- Tone, target audience, language and detail level are not standardised.
- Outputs created by different teams often become inconsistent.

❖ Proposed Solution: Transform AI

Transform AI is an AI-powered content transformation engine that converts a common source of information into the exact deliverable selected by the operator.

- Operator submits source content and selects one or more output formats.
- System analyses context, intent and communication objective.
- AI generation layer produces structured artefacts ready for review and use.

❖ Core Value Proposition

- Generates Video Package, LinkedIn Post, X/Twitter Post, Advisory, Infographic, Executive Summary and Presentation from the same input.
- Reduces repetitive manual writing and improves operational efficiency for communication teams.

❖ Supported Deliverables Generated From the Same Source

❖ Layered Architecture

❖ Actual Repository Responsibilities

index.html	Dashboard UI, source input area, output type selection, parameter capture and response display.
analyze.js	Prepares source content for AI analysis and extracts the context needed for reliable generation.
generate.js	Creates the selected artefact using output-specific instructions and structured response format.
verify.js	Validates request/response quality, checks required fields and supports the review workflow.
Vercel	Runs frontend and serverless APIs from the GitHub repository with environment variables.

❖ Technology Stack

HTML5, CSS3, JavaScript, Serverless Functions, AI/LLM API, GitHub and Vercel.

❖ AI Processing Logic

- Classifies input type and user objective before generation.
- Uses selected controls: target audience, tone, language, detail level and style.
- Applies output-specific templates so every artefact has the required structure.
- Returns formatted content that can be reviewed, copied or exported.

Goal: reliable source-to-format transformation

❖ Quality Controls

- Verification API checks basic validity and required output sections.
- Human review step before publishing sensitive content.
- Consistent formatting rules for each selected artefact.
- Error handling for empty inputs, unsupported formats and failed responses.

Goal: accurate and review-ready artefacts

❖ Security & Privacy

- API keys are stored in environment variables, not in frontend code.
- Frontend and API functions are separated to protect sensitive configuration.
- Request validation helps avoid malformed calls.
- Future version can add role-based access, audit logs and organisation policies.

Goal: safe deployment and controlled access

❖ Expected Impact

- Reduces repetitive manual conversion of one source into multiple communication formats.
- Improves consistency of tone, structure, messaging and quality across teams.
- Supports faster response for announcements, advisories, incident reports and executive communication.
- Allows operators to focus on review and decision-making instead of rewriting content.

❖ Operational Benefit

- One dashboard for input, controls and output.
- One analysis can generate many artefacts.
- Useful for government, cybersecurity, media, education and PR teams.

❖ Scalability & Future Scope

- Add new output types as independent generator templates.
- Support document, image and video understanding.
- Add PDF/PPT export and automated subtitle generation.
- Enable organisation-specific templates and approval workflows.
- Add user accounts, role-based access, history and version control.
- Integrate social media publishing and enterprise communication tools.

❖ Deployment Path

- GitHub repository for source control.
- Vercel for frontend + serverless API hosting.
